

PRUDENT®

Phosphite Fertilizers That Last

You're Paying for Phosphite; **MAKE SURE YOU'RE APPLYING PHOSPHITE**

It is a common knowledge that the phosphite (PO_3) content of fertilizers can convert to phosphate (PO_4) while stored in their jugs or containers. This is because most phosphite fertilizers are formulated with added water, and, phosphite (PO_3) can convert to phosphate (PO_4) in the presence of water, beginning shortly after production. The Prudent® family of phosphite fertilizers* are the exception, since they are produced without adding water, keeping the phosphite stable in the jug.

To document the stability of Prudent®44/42cw, we commissioned Stillmeadow Labs, an independent EPA-qualified lab, to test the PO_3 content of Prudent 44 samples taken the day of production and taken more than 9 months after production.

As the graphs above show, the PO_3 in Prudent® 44/42cw remained the same after 9 months.

Prudent® stability is the PERFORMANCE® Advantage
